

Agenda and Notes

For Wednesday May 22, 2024

Overview

- Review of status of bug fixes for “Version 1”
- Review of “easy” new features for “Version 2”
- Review of “hard” new features for “Version 2”
 - Screenshots of possible configuration on the UI
- Discussion of level of effort and timeline

Bug fixes for V1

- Table rows disappearing when creating new target or deleting old target
- Not all column entries appear in the table
 - This is true both on the UI and in the exported CSV, in particular Systemic Velocity
- Refreshing page shows old information
- Rise/Set calculation
- Jmag/Gmags won't allow typing a decimal point (but do allow pasting in a decimal number)
- Specify Gaia DR3 is preferred, then DR2 or DR1 if necessary
- In light mode, buttons not visible

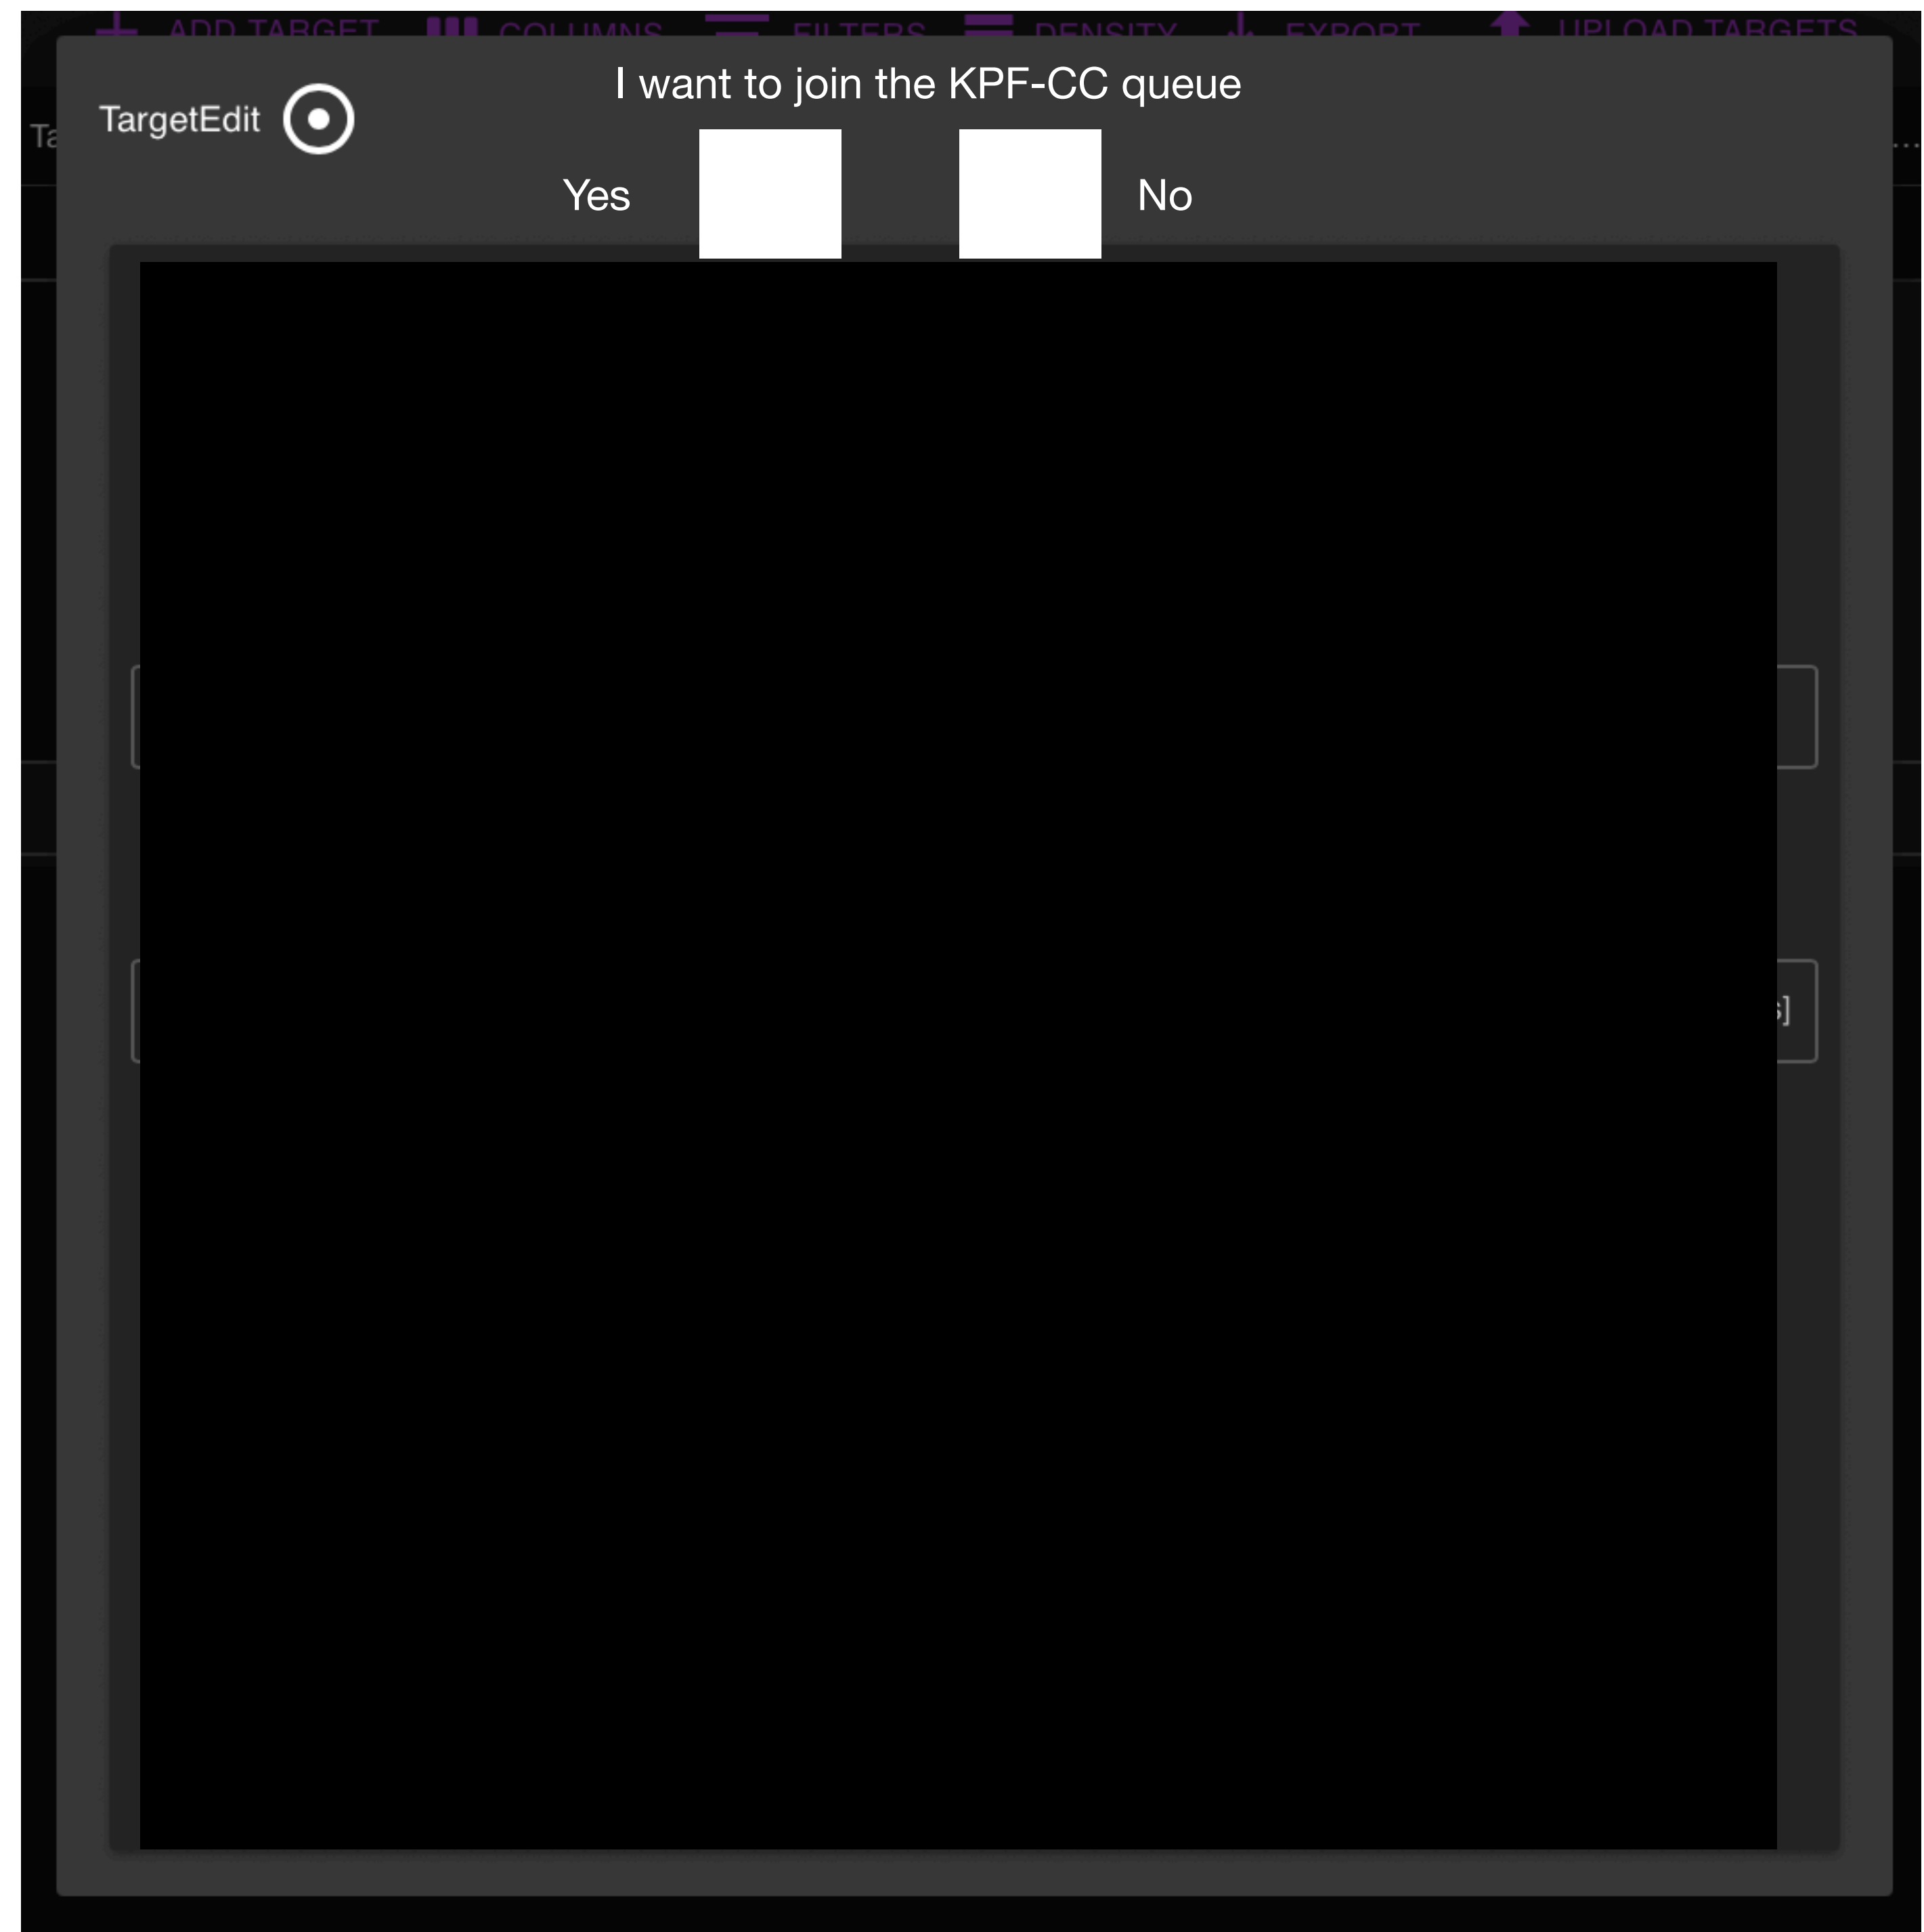

V2 updates “easy”

- Let's add a “query from Gaia” option. If the user inputs a Gaia DR3 number in the target name box (we must specify input formatting), then we pull info from Gaia archive instead of Simbad.
 - Also, even if pulling from Simbad, if Simbad has a Gaia ID, let's always pull the Teff from Gaia archive query
- Add button to download a “user” version CSV. Then they can fill it out on their own and upload it back, and autofill all cells of the table
 - This “user” version will only have data columns, not the meta data columns of like “target status”, etc

V2 updates “hard”

- Add “Opt In” flag at top
- Add “Multi-hour observation” flag
- Display different table fields depending on the values of these two booleans
- See images on next slides

- A big button to opt in or opt out of the queue.
- This button must be selected one way or the other in order to reveal the additional fields

- If they do not want in to the queue, then we reveal and require only the target information fields

TargetEdit 

I want to join the KPF-CC queue

Yes ☐ No ☒

Target Information

Target Name		Effective Temperature ...	
Right Ascension [hour...]	Declination [dd:mm:ss]	J Magnitude	G Magnitude
GAIA Identifier		TIC Identifier	
Proper Motion in RA [...]	Proper Motion in Dec [...]	Epoch	Systemic Velocity [km/s]

- If they opt in, then we also reveal the observation info section
- But also a second opt-in button to indicate multi-hour observations
- If not selected, then we display the usual parameters from V1 and require all of them

TargetEdit 

I want to join the KPF-CC queue

Visits per Night

of Nights Per Semester

Minimum Inter-Night Cadence

Minimum Intra-Night Cadence

Observing Notes

 This is a multi-hour visit (RM)

- If this is a multi-hour observation, then we display different fields and only require those
- Definitely these 4, maybe others, I'll have to think about potentially adding more.

Discussion of Effort and Timeline

- For V1 bug fixes?
- For “easy” V2 updates?
- For “hard” V2 updates?
